

Genus Content Migration Services

SOLUTION HIGHLIGHTS

- > Proven approach utilized to migrate billions of documents
- > Quicker completion decreases the impact on business processes
- > Comprehensive process includes everything from content extraction through final audit reporting

ABOUT GENUS TECHNOLOGIES

Genus helps our customers solve complex digital transformation challenges through intelligent document automation, content services, and process transformation solutions. We deliver high ROI projects that improve operational effectiveness in the critical areas of cost, productivity, quality, service, and risk.

Genus has over 25 years of experience working with major ECM systems, such as IBM FileNet, IBM Content Manager, Hyland-Nuxeo, and more. Some of the world's largest companies have turned to Genus to help them manage their most critical business data.

genustechnologies.com

A proven migration approach that reduces the risks and costs of your migration project.

Eliminate Risk with Migration Assistance from the Pros

Migrating unstructured content can be risky, time-consuming, and expensive. Experience really counts when transitioning critical enterprise content to new systems. Our team has worked with many of the leading ECM systems and migrated billions of objects. You can trust that our consultants have the knowledge to plan and execute the most challenging content migration efforts.

The Genus-developed migration toolkit automates and monitors the migration process and complements built-in functionality from source and destination systems. By using them together, Genus can quickly and cost-effectively migrate the content.

Project Team

Genus brings an experienced team that will cover all facets of your migration project. Their broad range of skills includes project management, technical design of the migration process, migration process initiation and monitoring, technical troubleshooting, ability to configure tools to specific project requirements, understanding of source and destination system functions, data validation, and all the other challenges unique to moving enterprise content between systems.

Comprehensive Approach

At the start of the project, we work with you to plan your migrations around critical business processes and operations that will minimize the impact on users. We also ensure that the migration effectively uses your professional and technical resources and follows your security and compliance policies.

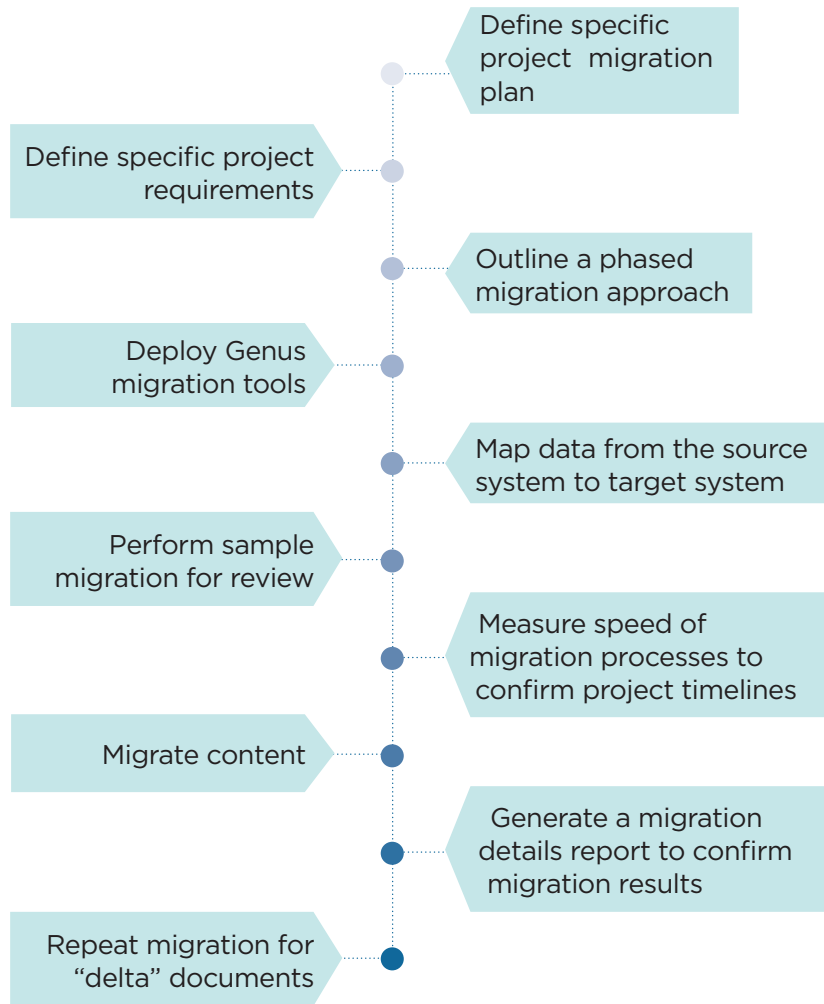

Migrating unstructured content is more challenging than migrating the raw data of structured content. Unstructured content must remain accurate and intact, including all the associations between documents and their properties.

Genus manages these complexities by completing an inventory of all source content before migration. We then confirm migration accuracy against that inventory with process audit logs and tests of the content state in the destination system. This process validates the successful migration of each content object, its properties, and associated links.

Historically, one of the most troublesome parts of a migration is dealing with items that do not migrate. Genus's toolkit identifies these objects and logs enough detail to resolve issues rapidly. Our migration process includes "delta" migrations to transfer those failing items and other new or modified content.

Migration Process at a Glance

At the start of the project, we work with you to plan your migrations around critical business processes and operations. We also ensure that the migration effectively uses your professional and technical resources and follows your security and compliance policies.

Additional Migration Services Available

Genus can supply other migration services to address your specific business needs.

- > Migrate documents into complex taxonomies
- > Migrate annotations
- > Migrate selected content based on life cycle stage
- > Change file formats
- > Transform document metadata to comply with enterprise taxonomy standards
